Hunter 100 engine is equipped with a Trochoid type crankshaft driven oil pump which ensures a constant oil flow rate of 3.14 Litres/minute. The internal oil galleries are designed to secure and protect oil flow without any hindrance. The area near the combustion chamber has less height difference to ensure high oil flow and optimum cooling. This advanced oil circulation technology ensures better cooling and lubrication of the engine

Hunter 100 has three filter elements to avoid dust entry into the combustion chamber leading to higher engine life. The first is the air deflector ensuring clean air entry, whilst the second and third are the primary and secondary filters made from Polyurethane foam that absorb finer dust particles ensuring only clean air enters the carburettor.
